

What can I expect during construction?

Work will be completed so that temporary disruptions in the neighborhood, such as noise and dust, will be minimized as much as possible. Sewage odors will NOT be present in homes, but may be present outside.

During construction, residents can expect to see equipment in the road and new traffic patterns in place, as listed and shown below:

- Partial road closures
- Sidewalk closures
- Limited street parking
- Possible detours

Fruit Belt Neighborhood Sewer Improvements

PROJECT INFORMATION

Why is Buffalo Sewer doing this project?

Buffalo Sewer is working diligently to improve the City's existing sewer infrastructure in a cost-effective manner. Large portions of the Fruit Belt's sewers are 90 to 100 years old, as are many of the private lateral connections between houses and the sewer line. Failing or abandoned laterals are suspected to be the cause of past issues such as sink holes and ground settlement in the roadway and other areas. This project will renew the Fruit Belt infrastructure and combat these historic issues for years to come.

What is included in this project?

- Pipe cleaning and video inspections
- Existing sewer spot repairs
- Replacement of receiver pipes
- New sewer lining (ultraviolet cured-in-place pipe)

Will my service be affected?

Residents may experience temporary sewer service interruption / limited use. Residents will be notified of construction in advance and details will be provided at that time.

Project Area

- Maple St, Mulberry St, Locust St, Lemon St, Orange St, and Rose St. between BFNC Dr. and E. North St.
- Peach St. and Grape St. between BFNC Dr. and Best St.
- Beech St. between BFNC Dr. and Carlton St.

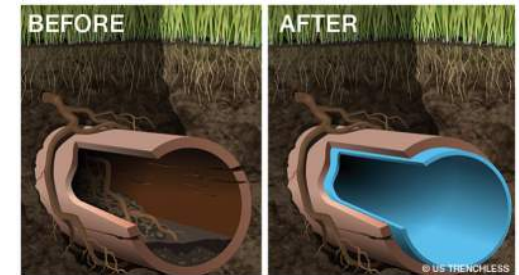

When will construction begin?

- Construction started in November 2025 and will finish by Summer 2026.

What is UV CIPP lining?

- Ultraviolet (UV) cured-in-place pipe (CIPP) is a pipe repair technology that does NOT require old pipes to be dug up and replaced.
- A liner is inserted from ground level into the pipe. Then, UV light is inserted to harden the liner into a new surface inside the pipe (the new lining is shown in blue in the image below).

What are the benefits of UV CIPP lining?

Compared to alternative CIPP processes that use hot water or steam and chemicals to harden the liner, UV installation is faster, safer, minimizes disturbances, and reduces chemical emissions while increasing pipe durability.
